

Lab Sheet 05 - Year 03

IE3031 – Management Information Systems

The given dataset contains regional business sales records of a multinational company operating across several regions from 2011 to 2015.

Each record represents a completed sales order, including region, item type, year, units sold, and total profit.

You are required to analyze the dataset using MS Excel and answer the following questions.

Tasks

1. Create a pivot table to display the total profit earned by each region separately.
2. Modify the pivot table to display the total profit based on the year.
3. Update the pivot table to show the average profit of each region by year.
4. Create a pivot chart (column graph) to display the average profit of regions in the years 2011, 2012, and 2013.
5. Find the total number of units sold under each item type using:
 - a. SUMIFS function
 - b. Pivot Table
 - c. Identify the efficient way out of a and b above and briefly describe the reason.
6. Using the pivot table, display sales records only for the Asia region using filters.
7. Create a pivot chart (bar graph) to display item-wise units sold in Asia.
8. Identify which item type has the highest sales in Asia.

You are required to show all workings in arriving at the required answers using MS Excel.

Name the file with the student registration number. Upload your answers to the link given in Courseweb.
